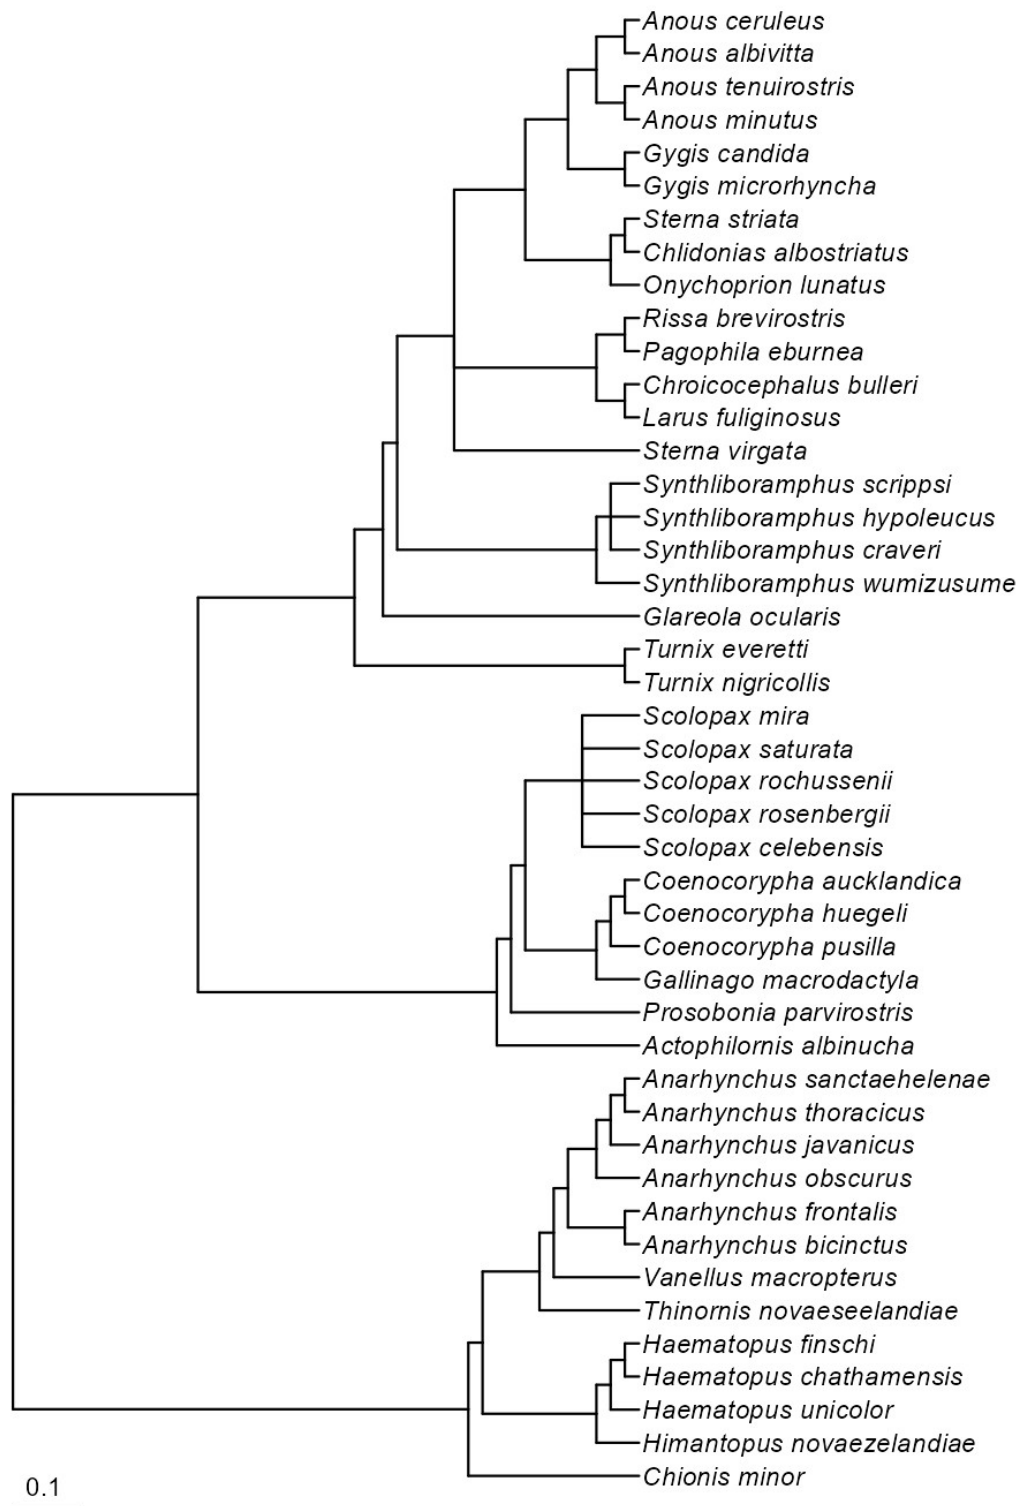

Fig. S1. Phylogenetic tree depicting the relatedness of the 45 endemic species of Charadriiformes used for the analysis. Please note that nomenclature shown in the tree follows Billerman et al. (2025), while the phylogenetic relationships were constructed using the information from Rees & Cranston (2017).

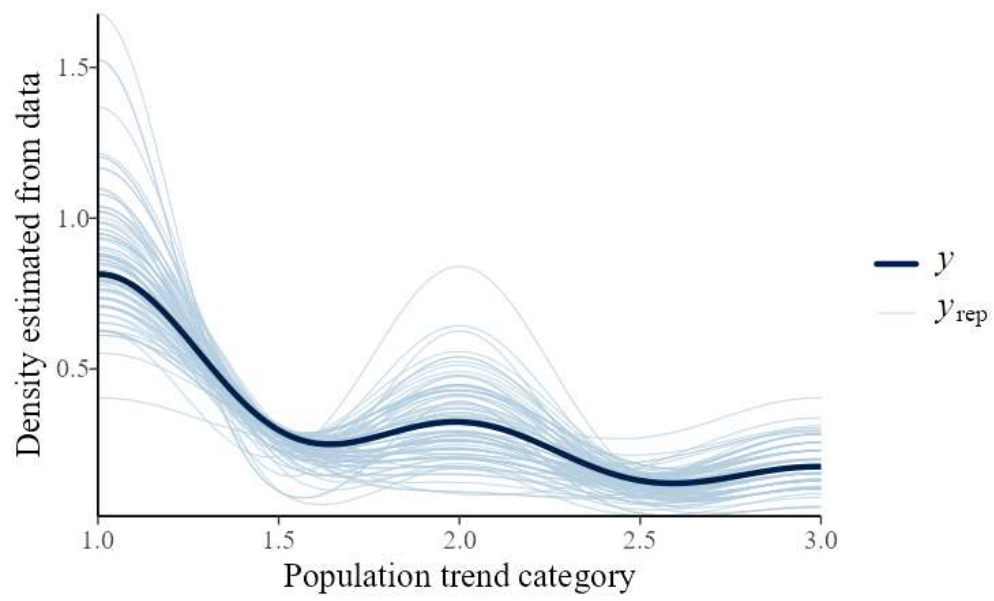

Fig. S2. Graphical posterior predictive check comparing empirical distribution of the observed data (y , thick line) to the distribution of simulated data from the posterior predictive distribution of the model using 100 random draws (y_{rep} , thin lines).
